12.2.1 Three-phase Half-wave Rectifier. Figure 12.1 shows the three-phase half-wave rectifier topology. To control the load voltage, the half-wave rectifier uses three common-cathode thyristor arrangement. In this figure, the power supply and the transformer are assumed ideal. The thyristor will conduct (ON state), when the anode-to-cathode voltage v_{AK} is positive and a firing current pulse i_G is applied to the gate terminal.

A failure phase occurs when power is lost from a three-phase motor power supply line. The motor is still running, but it draws excessive current. This phenomenon is known as Single phasing. Single phasing causes a current increase of 173% in average of both phases which remain energized in a three-phase motor.
