a repeating pattern of chemical properties in elements. Mendeleev arranged the elements in order of increasing atomic mass, to form something that resembles the modern periodic table. He was even able to predict the properties of some of the then-unknown elements.

Periodicity refers to the recurring trends that are seen in the element properties. These trends became apparent to Russian chemist Dmitri Mendeleev (1834–1907) when he arranged the elements in a table in order of increasing mass.

trends or recurring variations in element properties with increasing atomic number. Periodicity is caused by regular and predictable variations in element atomic structure.

Mendeleev organized elements according to recurring properties to make a periodic table of elements.

The periodic table shows periodicity in the following properties : • Atomic size - atoms of elements tend to increase as you go down a group (due to a greater number of energy levels) and atoms of elements tend to decrease in size across a period
