A mole (mol) is a number of things equal to the number of atoms in exactly 12 g of carbon-12. Experimental measurements have determined that this number is very large: $1 \text{ mol} = 6.02214179 \times 10^{23}$ things Understand that a mole means a number of things, just like a dozen means a certain number of things—twelve, in the case of a dozen.

Why use the mole? Chemists need a convenient method for accurately counting the number of atoms, molecules, or formula units in a sample of a substance. Because atoms are so small its impossible to count them directly. Therefore, the MOLE was developed.

Chapter 10

What is the mole? Chemists use the mole to count atoms, molecules, ions, and formula units. It is important to note that a mole always contains the same number of particles. For example, you know that a dozen eggs will always contain 12 eggs. Likewise, a mole will always contain 6.022×10^{23} particles. Although a mole of any substance is the same number, different substances have different molar masses.
