Width is the stereo field from left to right. A key psychoacoustic principle used to achieve the illusion of width is the Haas effect, which explains that when two identical sounds occur within 30 milliseconds of one another, we perceive them as a single event. Depending on the source material, the delay time can reach 40 ms.

Psychoacoustic parameters like loudness, sharpness, tonality or roughness have to be taken into account to achieve a complete rating of sound quality. The implemented algorithms calculate the most important psychoacoustic parameters which are then integrated into the acoustic mapping. The values are represented by a color scale and superposed to the optical image of the investigated object.
