Fatigue is a major cause of failure, particularly in welded structures, reflecting the inherently poor fatigue performance of many welded joints (

Fig.1). This emphasises the need for due consideration of potential fatigue failure at the design stage, and for clear design guidance. In fact, considerable effort has gone into the production or revision of fatigue design rules in recent years, particularly in the European Union in view of the adoption of common Standards.

For purposes of evaluating fatigue, weld joints are divided into several classes. The classification of a weld joint depends on: the macroscopic geometry of the pieces welded, the direction of the cyclic stresses,
