The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials,

aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway. What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. An account of Franklin Roosevelt's battle against the power industry to bring electricity to rural communities in the United States. When Franklin Delano Roosevelt took office in the depths of the Depression, high tension—or high voltage—power lines had been marching across the country for decades, delivering urban Americans a parade of life-transforming inventions from electric lights and radios to refrigerators and washing machines. But most rural Americans still lived in the punishing pre-electric era, unconnected to the grid, their lives consumed and bodies broken by backbreaking chores. High Tension is the story of FDR's battle against the "Power Trust," an elaborate Wall Street-controlled web of holding companies, to electrify all of America—even when the corrupt captains of the industry and their cronies (led by a formidable and honest champion,

Wendell Willkie, whose role in the battle propelled him to a presidential bid to unseat Roosevelt in 1940) cried that running lines to rural areas would not be profitable and that in a free market there would simply have to be a divide between the electricity haves and have-nots. Roosevelt knew better. And in this story of shrewd political maneuvering, controversial legislation, New Deal government organizations like the Tennessee Valley Authority, the packing of Federal courts, towering business figures, greedy villains, and the crying needs of farmers and other rural citizens desperate for services critical to their daily lives, John A. Riggs has chronicled democracy's greatest balancing act of government intervention with private market forces. Here is the tale of how FDR's efforts brought affordable electricity to all Americans, powered the
